The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human blood ceil surface antigen, CD109. CD109 is a variant of r150 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel transforming growth factor (TGF)-beta 1 binding reagent which comprises r150 protein which acts as accessory receptor of TGF-beta, useful for negatively modulating TGF-beta activity, and thus for treating cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  24-APR-2001;

                                                                                                                                                                                                                                                                                                                                                        The invention relates to novel transforming growth factor (TGF)-betal binding reagent which comprises a glycosylphosphatidyl inositol (GPI)-anchored TGF-betal binding protein referred to as r150 which acts as an accessory receptor of TGF-beta. The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human r150 protein.

The invention relates to isolated nucleic acid molecules encoding CD109 CC polypeptides. These nucleic acid molecules (CD104) and (CD105) KI. (CD105) Is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 (CD105) is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 (CD105) is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 (CD105) is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 (CD105) is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 (CD105) is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 (CD105) polypeptides can be compressed to rise and continuous activation activation of polypeptides or impaired activation of Tlymphocytes (CD105) polypeptides or impaired activation of Tlymphocytes (CD105) polypeptides or impaired activation of Tlymphocytes (CD105) polypeptides (CD105) polyp
                                                                                                                                                               Matches 1062;
                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                           for treating or detecting a disease or disorder, e.g. conditions associated with endothelial activation, platelet activation, activation of the coagulation or fibrinolytic systems, activation of Tlymphocytes and of the complement system, quantitative or qualitative abnormalities of platelet function, increased or impaired platelet aggregation and activation, increased or impaired activation of the coagulation and/or fibrinolytic systems, or impaired or increased inmune activation. These are also useful for treating cardiovascular disorders, stroke, myocardial infarction, thrombosis, embolism, peripheral vascular disease, thrombosytopenia, thrombosythemia, autoimmune diseases, organ transplantation, or bone marrow transplantation. The CD109 nucleic acids or their antisense nucleotide sequence are useful in gene therapy for
                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated nucleic acid molecules encoding CD10; polypeptides. These nucleic acid molecules include the human cDNA sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variant; CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, (family of thioester-containing proteins. The CD109 polypeptides can be expressed by standard recombinant methodology. The CD109 nucleic acid, CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New CD109 nucleic acids and polypeptides, useful in gene therapy, particularly for treating strokes, myocardial infarctions, thrombostopenia, autoimmune diseases, or organ or bone marrow transplantation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CD109; alpha2 macroglobulin; thioester; cerebroprotective; cardiant immunosuppressive; haemostatic; anticoagulant; thrombolytic; human; cardiovascular; vasotropic; gene therapy; CD109 K15; variant.

The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human blood cell surface antigen, CD109. CD109 is a variant of r150 sequence.

Note: This sequence is stated to be encoded by human CD109 DNA shown in figure 17 of the specification, but this does not appear to be the

                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes 3 variants of human unc-5C cDNAs (unc-5Cb, unc-5Cc and unc-5C8) which correspond to alternatively spliced unc-5C transcripts, and a human unc-5HS1 cDNA which shares homology with the Rattus norvegicus unc-5HS1 cDNA. Also described are assays based on protein-protein-interactions between the unc-5 protein and a variety of different interacting proteins. The unc-5 corribated and unc-5HS1 cDNA are useful in methods for identifying compounds which reduce or inhibit the lethal phenotype associated with the expression of the unc-5 death domain in yeast. They are also useful in yeast two hybrid experiments for identifying unknown human cDNAs which encode proteins that interact with the human unc-5C protein. Patent No. 6472140
Patent No. 6472140
GENERAL INFORMATION:
APPLICANT: Tanzi, Rudolph E.
APPLICANT: Tanzi, Rudolph E.
APPLICANT: Saunders, Aleister J.
APPLICANT: Sunders, Aleister J.
TITLE OF INVENTION: Alpha-2-Macroglobulin Therapies and Drug Screening Methods for TITLE OF INVENTION: Alzheimer's Disease
FILE REFERENCE: 0609.4460003
CURRENT APPLICATION NUMBER: US/09/241,606
CURRENT FILING DATE: 1999-02-02
NUMBER OF SEQ ID NOS: 27
SOCTWARE: PatentIn Ver. 2.0
SEQ ID NO 2
LENGTH: 1474

US-08-793-126-1
; Sequence 1, Application US/08793126
; Patent No. 5849297
; GENERAL INFORMATION:
APPLICANT: Harrison, Richard Alexander
; APPLICANT: Farries, Charles Timothy
TITLE OF INVENTION: MODIFIED HUMAN C3 PROTEINS
; NUMBER OF SEQUENCES: 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
